Introduction

The Recherche Data Gouv repository contains datasets organised in tree-like Dataverse collections.

What is a dataset?

- coherent **set of raw or derivated data**
- **with metadata associated** to it to describe the data (presentation, publication date, perennial identifier, etc.)
- **in different formats** (such as texts, figures, images, etc.)
- associating **one or more file(s)**

A DOI is automatically assigned to each dataset deposited in the Recherche Data Gouv repository.

What is a collection?

Dedicated **space** to the datasets of a **community** (a laboratory, research project, etc.) or a theme.

Each collection may **contain**:

- Dataverses subcollections
- Datasets.

What is an institutional space?

- **collection created** following a request from a **French research organisation** which then manages and curates the space by delegation
- it contains datasets that can be **grouped into collections or subcollections**.

What is the generic space?

Designates the collection where depositors **without an institutional space** can deposit their datasets.

A carousel on the home page gives users direct access to collections associated with institutions (institutional space), and to generic space.

Curation of datasets

A series of checks of the **conformity and completeness** of certain **metadata and documentation, the validity of links and so forth.**

Curation may be carried out before or after publication of the dataset. The depositing author may be asked to make modifications after these checks. The level of curation is the responsibility of the collection administrator.

The curation stage allows you to register your data in compliance with **FAIR principles** (open formats, license...).
